Amazon Web Services

EC2

Compute services

- Amazon maintains many thousands of servers. Each server hosts many virtual machines
- You can sign up for EC2 and rent virtual machines with a certain number of CPU cores and a certain amount of memory

Amazon Web Services

EC2

Compute services

EBS

Block storage
(like a local
filesystem, but
accessed over a
network)

- Amazon maintains large network of storage arrays
- Disk arrays are networked so that even if one array fails, the system will stay up
- You can mount any EBS volume from any EC2 instance in the same datacenter
- The EBS volume appears as if it's a normal hard drive. An EBS volume can only be mounted to one EC2 instance at a time

Amazon Web Services

EC2

Compute services

EBS

Block storage
(like a local
filesystem, but
accessed over a
network)

S3

Object storage
(sort of like Google
Drive)

Amazon Web Services

EC2

Compute services

EBS

Block storage
(like a local
filesystem, but
accessed over a
network)

S3

Object storage
(sort of like Google
Drive)

Glacier

Archive storage
(like S3, but cheap and
glacially slow)

Amazon Web Services

Compute

-  **EC2**
Virtual Servers in the Cloud
-  **EC2 Container Service**
Run and Manage Docker Containers
-  **Elastic Beanstalk**
Run and Manage Web Apps
-  **Lambda**
Run Code in Response to Events

Storage & Content Delivery

-  **S3**
Scalable Storage in the Cloud
-  **CloudFront**
Global Content Delivery Network
-  **Elastic File System** PREVIEW
Fully Managed File System for EC2
-  **Glacier**
Archive Storage in the Cloud
-  **Import/Export Snowball**
Large Scale Data Transport
-  **Storage Gateway**
Integrates On-Premises IT Environments with Cloud Storage

Database

-  **RDS**
Managed Relational Database Service
-  **DynamoDB**
Predictable and Scalable NoSQL Data Store
-  **ElastiCache**
In-Memory Cache
-  **Redshift**
Managed Petabyte-Scale Data Warehouse Service

Networking

-  **VPC**
Isolated Cloud Resources
-  **Direct Connect**
Dedicated Network Connection to AWS
-  **Route 53**
Scalable DNS and Domain Name Registration

Developer Tools

-  **CodeCommit**
Store Code in Private Git Repositories
-  **CodeDeploy**
Automate Code Deployments
-  **CodePipeline**
Release Software using Continuous Delivery

Management Tools

-  **CloudWatch**
Monitor Resources and Applications
-  **CloudFormation**
Create and Manage Resources with Templates
-  **CloudTrail**
Track User Activity and API Usage
-  **Config**
Track Resource Inventory and Changes
-  **OpsWorks**
Automate Operations with Chef
-  **Service Catalog**
Create and Use Standardized Products
-  **Trusted Advisor**
Optimize Performance and Security

Security & Identity

-  **Identity & Access Management**
Manage User Access and Encryption Keys
-  **Directory Service**
Host and Manage Active Directory
-  **Inspector** PREVIEW
Analyze Application Security
-  **WAF**
Filter Malicious Web Traffic

Analytics

-  **EMR**
Managed Hadoop Framework
-  **Data Pipeline**
Orchestration for Data-Driven Workflows
-  **Elasticsearch Service**
Run and Scale Elasticsearch Clusters
-  **Kinesis**
Work with Real-time Streaming data

Internet of Things

-  **AWS IoT** BETA
Connect Devices to the cloud

Mobile Services

-  **Mobile Hub** BETA
Build, Test, and Monitor Mobile apps
-  **Cognito**
User Identity and App Data Synchronization
-  **Device Farm**
Test Android, Fire OS, and iOS apps on real devices in the Cloud
-  **Mobile Analytics**
Collect, View and Export App Analytics
-  **SNS**
Push Notification Service

Application Services

-  **API Gateway**
Build, Deploy and Manage APIs
-  **AppStream**
Low Latency Application Streaming
-  **CloudSearch**
Managed Search Service
-  **Elastic Transcoder**
Easy-to-use Scalable Media Transcoding
-  **SES**
Email Sending Service
-  **SQS**
Message Queue Service
-  **SWF**
Workflow Service for Coordinating Application Components

Enterprise Applications

-  **WorkSpaces**
Desktops in the Cloud
-  **WorkDocs**
Secure Enterprise Storage and Sharing Service
-  **WorkMail** PREVIEW
Secure Email and Calendaring Service

Amazon Web Services

- Estimated 1.3 million servers¹ in 68 datacenters²
- Custom routers. 100 Gbps interconnects between data centers, 25Gbps connections to each server
- Custom server design, custom motherboard chipsets, custom GPUs and FPGAs
- Custom storage servers. Each rack contains 1110 hard drives, 8.8 petabytes of storage

Benefits of “cloud computing”

- **Benefits to AWS users:**
 - No huge up-front infrastructure investment
 - No need to hire dedicated systems administrators
 - Stability benefits of globally distributed infrastructure
 - Flexibility in handling load... Pay only for what you need and avoid getting slammed in a high-load event
- **Benefits to Amazon:**
 - Rent out unused storage capacity, make lots of money
 - Infrastructure investments benefit Amazon as well
 - \$\$\$\$\$\$\$\$\$\$

If we were to rethink filesystems built for cloud services, what would they look like?

How And What We Build Is Always Changing

Earliest days

- Assembly programming on single machines

Big single-machine advances

- Unix: A standard (and good) OS!
- C: A systems language!

Same thing, one level up: Distributed systems

- Collect group of standard machines,
build something interesting on top of them

Commonality: **New System on Fixed Substrate**

Whether a single machine/distributed, we tend to build **new systems** on a **fixed set of resources** with **fixed (sunk) cost**

- Machine: X CPUs, Y GB memory, Z TB storage
- Buy many such machines
- Build new system of interest on those machines

But the world is changing...

Welcome To Cloud

Cloud is a reality

- Can **rent** cycles or bytes as needed
- Per-unit **cost** is defined and known
- Not just raw resources: **services** too

Many new systems are being realized only in cloud

- Excellent example: **Snowflake** elastic warehouse
[sigmod '16]

Thus, Questions

Cloud-native thinking:

How should we build systems given the cloud?

- What new opportunities are available?
- What new systems can we realize?
- What can we stop worrying about?

In This Talk

Cloud-native principles

- Guidelines for how to think about building systems in the era of the cloud

Cloud-native file system

- Case study: How to transform a local file system into a cloud-native one

Principles

Storage principles

CPU principles

Overarching principle

(just highlights; more in paper)

Storage Reliability

Storage reliability principle:

Highly replicated, reliable, and available storage can (should?) be used (The “S3” principle)

- 11 “9s” of durability!

Implication: Build on top of this, don't build YARSS (Yet Another Replicated Storage System)

- Example (kind of): BigTable on GFS

Storage Cost and Capacity

Storage cost principle:

Storage space is generally inexpensive

- At cheapest, \$4 / month / TB

Storage capacity principle:

A lot of storage space available

- “The total volume of data and number of objects you can store are unlimited” (Amazon)

Implication: Use space as needed to improve system

- Example: Indices for added lookup performance

Storage Hierarchy

Storage hierarchy principle: Storage is available in many forms, with noticeable differences in performance and cost across each level

- Example: Amazon Glacier vs S3

Implication: Must manage data across levels

- Can improve performance, reduce costs

CPU Parallelism

CPU parallelism principle (or $A \times B = B \times A$):

It should cost roughly the same to execute on A CPUs for B seconds as it does to execute on B CPUs for A seconds

- Granularity of accounting might limit you...

Implication: Do everything you can in parallel

CPU Capacity

CPU capacity principle:

Large numbers of CPUs are available

- As with storage, essentially “unlimited”

Implication: Use as many CPUs as you need

- Scale up to solve tasks quickly

CPU Scale-Up/Down

CPU scale-up/scale-down principle:

One should only use as many CPUs as needed for a task, and not more

- While cheap, CPUs are not free either

Implication: Must monitor usage, turn off CPUs when unused

CPU Remote Work

CPU remote-work principle:

When possible, use remote CPU resources to do needed work

- Shared data store makes this easier

Implication: Can separate foreground/background

- Improve predictability of former, use parallelism for latter

CPU Hierarchy

CPU hierarchy principle: CPU is available in different forms, with differences in performance, cost, and reliability across each level

- Normal vs. spot instance for example

Implication: CPU types must be managed

- Pick CPU right for given task

Overarching Principle

Overall performance/cost principle:

Every decision in cloud-native systems is ultimately driven by a cost/performance trade-off

- Can't make decisions without cost/perf knowledge
- Extremes are interesting:
highest performance, or lowest cost
- But middle ground is important too:
“reasonable” cost/performance

Implication: Cost must be fundamental part of systems
(and even applications above)

Implications

Replicated storage: Don't reinvent the wheel

Extra space is cheap: Use for performance?

Massive parallelism: Use for background tasks

Hierarchy: Continuous data migration to lower cost while keeping performance high?

Cost: Have to know how much is OK to spend

Overall: Proper utilization of the cloud requires rethinking of how we build the systems above them

Case Study: CNFS

Case Study: CNFS

Case Study: **Cloud-Native File System (CNFS)**

Classic

File
System

Cloud-Native

CNFS

Cloud Block Service
(e.g., EBS)

CNFS Architecture

CNFS: Key Points

Copy-on-write (**COW**): Natural fit for cloud

- Enables background work on immutable storage

Storage work naturally offloaded from front end

- Enables predictable low-latency for foreground
- Adds massive parallelism for background

Can optimize for cost or performance or mix

- Need hints from above on what is important
- New APIs too

But, still needs help from cloud providers

- Example: Can't access EBS volumes from many clients (now)

Conclusions

Cloud Native

- New way to build systems upon substrate provided by Cloud

Principles: New guidelines for design

- **Higher-level services:** Don't reinvent the wheel
- **Flexible resources:** Can use a lot or a little
- **Different types of resources:** Costly/Fast vs. Cheap/Slow
- **Cost awareness:** Nothing is free

Case study: **CNFS**

- A local COW file system built to run on EBS (not a disk)
- Early prototype: Modified ext4 can migrate files across cloud volumes (but much still to be done)

Cloud-native thinking: How does it change your next system?

End
